

TERMITES

Fun fact for kids

Termites, like ants and bees, form organized colonies with roles like workers, soldiers, and reproducers.

Termites are renowned for their ability to digest cellulose, which is the main component of wood.

Termites decompose plant material and are found worldwide, except Antarctica.

Termite colonies range from a few hundred to millions of individuals in size.

Some species of termites build towering mounds that can reach several meters in height.

The termite queen can live for years and lay thousands of eggs daily.

Termites live in highly organized societies with a caste system similar to ants.

Termites digest cellulose with the help of microbes in their guts.
